

***Extend the lifetime of your Interscan Furnace:
Install a furnace on-off switch***

Situation:

- An Interscan which is inactive for more than 30 days often requires the sensor to be refreshed to stabilize drift in readings.
- This requires running the Interscan for several hours.
- **This process can shorten the life of the furnace.**

Solution:

- You can refresh the sensor without damage to the furnace by installing a furnace on-off switch (Furnace Thermocouple SPST Electronic Actuator).
- The switch enables you to easily turn the furnace “off” for the refreshing process and easily turn the furnace “on” for calibration and fumigant detection.

Act now! Have an Interscan furnace on-off switch installed for **\$175** with this flyer (regularly \$200). Prices do not include sales & use taxes, surtaxes, or freight. This offer is good until _____December 31, 2013_____
